

Report Title: Feasibility Study of Scholarship Recommendation System

Feasibility Study

A feasibility study is done to determine whether the proposed system can be developed successfully and used effectively. It helps identify whether the project is practical, affordable, and beneficial.

1. Technical Feasibility

The Scholarship Recommendation System can be developed using common web technologies such as HTML, CSS, JavaScript, PHP, and MySQL. These tools are easy to learn and freely available. A standard computer with an internet connection is enough to develop and run the system.

Result: The project is technically feasible.

2. Economic Feasibility

The project does not require expensive hardware or software. Most of the development tools, such as Visual Studio Code, XAMPP, and MySQL, are free. Therefore, the development cost is very low.

Result: The project is economically feasible.

3. Operational Feasibility

The system is easy to use for students, scholarship providers, and administrators. Students can easily search and apply for scholarships, while providers can manage scholarship information through a simple interface.

Result: The project is operationally feasible.

4. Schedule Feasibility

The project can be completed within one academic semester. The development process can be divided into planning, system design, implementation, testing, and documentation.

Result: The project is feasible within the available time.

Conclusion

The Scholarship Recommendation System is technically, economically, operationally, and schedule feasible. It is a practical project that can be successfully developed using available resources and will help students easily find scholarships that match their qualifications.
